

"What is your recommended method to break-in a Bullberry barrel?"

This is the most frequently asked question from customers purchasing a new Bullberry barrel. The stock answer is, "With a premium factory-lapped barrel in your hands the break-in has already been done." This is a true statement, but we also want you to take care of your new barrel.

We feel strongly that you should apply one of the synthetic bore treatment products on the market in order to prevent any type of fouling. We furnish a sample of Eezox™ Premium Gun Care with all new barrels in an effort to save you time, energy, and most importantly give you the most accurate firearm possible.

Use Eezox™ to clean your barrel initially, and after every shooting session. The simple process of pushing a couple of wet patches followed by a tight dry patch will usually suffice . . . no need to overdo it! A gray residue will show on your final patch. Don't work to remove this, as it will allow for continued lubrication and treatment. Using Eezox™ offers the advantages of moly-coated bullets without the danger of moly buildup. Eezox™ is great for properly cleaning older barrels too. Even barrels that have been slightly copper-fouled can be cleaned using very fine steel wool dampened with Eezox™. This will always be a more successful choice than an ammonia-based copper solvent, as Eezox™ will NOT open the microscopic pores in your barrel metal which leads to worse fouling in the future.

We have Eezox™ available in a variety of sizes to meet your needs. Just call or fax us to order yours today.
